Mihail Dimoski

Full-Stack Engineer · TypeScript, React / Next.js, Node.js, GraphQL

Skopje, North Macedonia

mihaildimoski.dev mihaildimoski@gmail.com +389 71 332 559 linkedin.com/in/mihail-di

Full-stack engineer with real backend depth. At Pabau I build the parts that must not fail quietly: webhook ingestion, queue consumers and security hardening. On my own I rebuilt and run a multi-tenant platform end to end. I write the failure mode down before the code, and use AI agents daily under guardrails I built.

EXPERIENCE

Software Developer, Pabau Clinic Software

October 2023 – present

Clinic-management SaaS · TypeScript and Node.js microservices, GraphQL, REST, RabbitMQ, MariaDB, React

- Built SMS delivery-receipt ingestion: a public webhook service verifying two providers' signatures (HMAC, Ed25519) at a stateless edge, feeding a queue consumer. Wrote the decision record.
- Hardened message sending on an at-least-once queue with no provider idempotency key, using guarded writes, no retry after a send and timeouts treated as indeterminate.
- Hardened patient-portal password reset against account enumeration with uniform responses, a latency floor and per-IP rate limits.
- Designed observability events across a migration between two GraphQL engines, surfacing real payment bugs.
- Earlier: search over 1.3 million clinical terminology rows, Stripe pricing per location, POS package accounting.

Frontend Developer (freelance), Truckers Flow

February 2023 – October 2023

Recruiting platform for trucking companies · Next.js, TypeScript, Material UI

- Led the frontend of the recruiter web app, with responsive layouts across desktop and mobile.
- Turned requirements into mockups, prototypes and functional documentation.

Mechanical Engineer, Hidro-Konsult, Skopje

November 2019 – April 2022

Hydraulic modelling and design documentation

PROJECTS

ATS Flow, applicant tracking for trucking recruiters

April 2025 – present (rebuild since July 2026)

Sole engineer on the rebuild (freelance) · Next.js · Pothos GraphQL · Prisma · MariaDB · Docker

- Rebuilt a WordPress backend on unindexed key-value tables as a multi-tenant GraphQL platform. Measured on production: slowest filter 14.4 s → 93 ms on the server, 15.2 s → 0.63 s on screen.
- Built a typed library of about fifty components whose design rules are enforced by the compiler: pages carry no class names.
- Tenant isolation by construction: tenant from the session, writes scoped by company, default-deny access, cross-tenant tests on a real database.
- Run it in production myself: phased deploys with backup before migrate and rollback by tag, encrypted nightly backups, SOPS secrets, alerting added after a real disk incident.
- About 4,000 tests and 32 decision records since July 2026, built with parallel AI agents under a protocol I wrote: isolated worktrees, a database per agent, verified landing.

Case study and live demo: mihaildimoski.dev/case/ats-rebuild

SKILLS

Backend	TypeScript, Node.js, GraphQL, REST, Prisma, SQL, MariaDB, Stripe, Twilio, SendGrid
Frontend	React, Next.js, TanStack, Zod
Delivery	Jest, Playwright, Docker, Helm, Git, CI/CD (Woodpecker CI), Traefik, Vercel, SOPS, Linux
AI workflow	Claude Code, parallel agents in isolated worktrees, commit guard hooks, AI review in the loop

EDUCATION AND LANGUAGES

Front-End Development Academy, Brainster — 2022 – 2023

Bachelor of Engineering, Mechanical Engineering, Ss. Cyril and Methodius University, Skopje — 2014 – 2021

Macedonian (native), English (fluent, daily working language)
