# Mihail Dimoski

## Full-Stack Engineer · TypeScript, React / Next.js, Node.js, GraphQL

Skopje, North Macedonia · open to remote EU and relocation

mihaildimoski.dev  mihaildimoski@gmail.com  +389 71 332 559  linkedin.com/in/mihail-di

Full-stack engineer with real backend depth. At Pabau I build the parts that must not fail quietly — webhook ingestion, queue consumers, security hardening — in TypeScript and Rust. On my own I rebuilt and run a multi-tenant platform end to end. I write the failure mode down before the code, and use AI agents daily under guardrails I built.

## EXPERIENCE

### Software Developer, Pabau Clinic Software

January 2024 - present (intern from October 2023)

Clinic-management SaaS · TypeScript, Node.js, Rust, GraphQL, RabbitMQ, MariaDB, React

- Built SMS delivery-receipt ingestion: a public webhook service verifying two providers' signatures (HMAC, Ed25519) at a stateless edge, feeding a queue consumer. Wrote the decision record.
- Made message sending safe on an at-least-once queue with no provider idempotency key — guarded writes, no retry after a send, timeouts treated as indeterminate — in TypeScript and Rust.
- Hardened patient-portal password reset against account enumeration with uniform responses, a latency floor and per-IP rate limits.
- Designed observability across a TypeScript-to-Rust GraphQL migration, which surfaced real payment and query bugs.
- Earlier: search over 1.3 million clinical terminology rows, per-location pricing on Stripe, point-of-sale package accounting.

## SELECTED WORK

### ATS Flow — applicant tracking for trucking recruiters

April 2025 - present (rebuild since July 2026)

Sole engineer on the rebuild (freelance) · Next.js · Pothos GraphQL · Prisma · MariaDB · Docker

- Rebuilt a WordPress backend on unindexed key-value tables as a multi-tenant GraphQL platform. Measured on production: slowest filter 14.4 s → 93 ms on the server, 15.2 s → 0.63 s on screen.
- Tenant isolation by construction: tenant from the session, writes scoped by company, default-deny access, cross-tenant tests on a real database.
- Run it in production myself: phased deploys with backup before migrate and rollback by tag, encrypted nightly backups, SOPS secrets, alerting added after a real disk incident.
- Built a typed library of about fifty components whose design rules are enforced by the compiler.
- About 4,000 tests and 32 decision records since July 2026, built with parallel AI agents under a protocol I wrote: isolated worktrees, a database per agent, verified landing.

**Case study and live demo:** mihaildimoski.dev/case/ats-rebuild

## EARLIER

**Frontend Developer (freelance)**, Truckers Flow · Next.js, TypeScript, Material UI — 2023

**Mechanical Engineer**, Hidro-Konsult, Skopje · hydraulic modelling and design documentation — 2019 - 2022

## SKILLS

| | |
|---|---|
| **Backend** | TypeScript, Node.js, Rust, GraphQL (Pothos, Hasura, Apollo), Fastify, RabbitMQ, Prisma, MariaDB / MySQL, Stripe, Twilio, SendGrid |
| **Frontend** | React 19, Next.js App Router, TanStack Query and Table, React Hook Form, Zod, Radix UI, CSS Modules |
| **Delivery** | Jest, Bun test, Playwright, Docker, Helm, GitLab, Bitbucket, Woodpecker CI, Traefik, Vercel, SOPS, restic, Linux |
| **AI workflow** | Claude Code, parallel agents in isolated worktrees, commit guard hooks, AI review in the loop |

## EDUCATION AND LANGUAGES

**Front-End Development Academy**, Brainster — 2022 - 2023

**Bachelor of Engineering, Mechanical Engineering**, Ss. Cyril and Methodius University, Skopje — 2014 - 2021

Macedonian (native), English (fluent, daily working language)
